```
The present invention relates to the coding sequence of the Pasteurella multocida chondroitin synthase. A chondroitin polysaccharide may be used as a hyaluconan polysaccharide substitute in medial or cosmetic applications, for example in eye or joint applications, for moisturiser or wound dressings. The enzyme may be used in covalently coupling specific drugs, proteins or toxins to the structurally modified chondroitin for general or targeted drug delivery or radiological procedures, covalently cross linking the hyaluronic acid itself or to other supports to achieve a gel or other three dimensional biomaterial with stronger physical properties, and covalently linking hyaluronic acid to a surface to create a biocompatible film or monolayer. The present sequence is one version of the coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240

                                                                                               This DNA sequence codes for the hyaluronate synthase (pmHAS, see AAY06212) of Pasteurella multocida Carter Type A. The pmHAS enzym has different kinetic optime with respect to pH and metal ion dependence, and different Km values compared with the HAS enzymes of Streptococcus equisimilis (see AAY06206) and Streptococcus of Straptococcus and always are about 2 - to 3 -fold lower for IOPs sugars, and Vmax values are about 2 - to 3 -fold higher. The invention provides recombinant vectors containing hyaluronate synthase DNA,

especially S. equisimilis hyaluronate synthase DNA (see AAX58841), and prokaryotic or eukaryotic host cells which produce the enzyme and its hyaluronic acid product, particularly a product with modified structure or molecular size. The hyaluronic acid produced this way is purer than that produced by conventional methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                43 ATTTTTAAAGGAAAGAAATGAATACATTATCACAAGCAATAAAAGCATATAACAGCAAT

Hyaluronic acid (HA) or hyaluronan, is a polysaccharide that serves both structural and recognition roles in higher animals. Bacteria produce extracellular capsules of HA which mimic their host HA and aid escape from a host immune response. The invention includes a vector containing the PMHAS nucleotide sequence which can be used to express PMHAS in a foreign host. The HS nucleic acids can be used for the production of HA. Also, specific changes to the HS coding sequence can result in the production of HA having a modified size distribution or structural configuration and functional properties. The HA products can be used for the HA in the production and functional properties. The HA products can be used to the HA in the production and functional properties. The HA products can be used to the HA in the products can be used to the HA in the HA products can be used to the HA in the HA in the beautiful the HA in the HA in the broaders can be used to the HA in the HA in the broaders can be used to the HA in the HA in the broaders can be used to the HA in the HA in the HA in the HA in the broaders can be used to the HA in the HA in the broaders can be used to the HA in the HA in the broaders can be used to the HA in the HA in the broaders can be used to the HA in the HA in the HA in the HA in the broaders can be used to the HA in the

The present sequence is the coding sequence of the soluble recombinant form of Pasteurella multocida hyaluronic acid synthase-D, PmHAS-D. This sequence encodes residues it or 703 of the 972 residues of the native FMHAS enzyme. PmHAS-D catalyses glycosaminoglycan polymerisation to produce hyaluronic acid, HA: a linear polysaccharide. HA has viscoelastic produce hyaluronic acid, HA: a linear polysaccharide. HA has viscoelastic consecutation which makes it useful for a number of applications. HA can be used during ophthalmic surgery as a viscoelastic replacement for the vitreous humour e.g. during implantation of intraocular lenses in cataract patients. HA injections directly into joints is also used to alleviate pain associated with arthritis. HA can also be used as bioadhesives for haemostatic sealing and healing of wounds and surgical incisions; and as biomaterials that provide custained delivery of encapsulated drugs, to wounds, ulcers, injuries or surgical sites. The present sequence can therefore be used to produce HA. or bioadhesives polysaccharide drug delivery systems, including hybrid molecules ø. oţ 86pp; English synthesis acceptor, useful for Page 84; 20; Claim

AAX12398 to AAX13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcus infection in an animal and monitoring progression of disease, and for identifying agents which can be used to

The present invention relates to nucleic acid sequences (ABG6/188-ABG71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-Listeria vaccines.
                                                                                                                                                                                                                                  ACCTTTAGTTTCTATTTATATCCCCGCTTATAACTGTGCAAATTATATTCAAAGATGTGT 1415

                                                                                                                                                                                                                                                                   The present invention relates to nucleic acid sequences as the Mab67188 AB071312) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of spene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-Listeria vaccines.

```
The present sequence encodes enzymes involved in the biosynthesis of exopolysaccharides (EPS). These enzymes are designated EPS1-EPS10, and are encoded by open reading frames eps1-eps10. The enzymes are isolated from Streptococcous thermophilus strain Sfi39. The proteins are used in a method for the synthesis of EPS, which includes at least one step of forming a bond (alpha or beta-isomer) between C-1 (carrying the reducing aldehyde function, of an activated D-galactose pyranose), and a phosphate on a lipophilic or proteinaceous primer. Stepwise synthesis of EPS occurs with, in each step, addition of a new sugar unit, through its hemi-acetyl function, to an alcoholic hydroxyl of a second sugar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           P-SSDB; AAYS4065, AAX54066, AAX54067, AAX54068, AAY54069, AAX54070.

ö
unit, present at the end of a chain of sugar residues bonded to the primer. EPS1 to EPS4 are used to elongate the EPS chain, and to regulate EPS production, EPS5 is used in the blosynthesis of EPS7 and EPS8 are beta-glycosyltransferases. EPS9 is a transporter of repetitive units, and EPS10 catalyses the conversion of a pyranose form of a beta-joalactose to the furanose form. The EPS enzyme are used to improve properties of foods, particularly fermented milk products such as yoghurt and cheese,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12974 CGCTACCAGTAATTTCCGATTTAATCTGTAGTCATCATAATATTAAGGTAATCAACCAAA 13033

The operon contains 10 open reading frames, and encodes enzymes (eps1, eps2, eps3, eps5, eps6, eps7, eps8, eps9 and eps10) that are involved in the biosynthesis of exopolysaccharides (EPS). The enzymes catalyse the formation of specific intersugar bonds. The enzymes catalyse a process that includes at least one step of forming a bond (in alpha or beta anomeric form) between Cl, carrying the reducing aldehyde group of an activated D-Galp (galactose in pyranose form), and a phosphate group on a lipophilic or proteinaceous primer. The enzymes are used to produce Eps that have antitumor or problotic properties or are used in foodstuffs to improve organoleptic qualities and flavour. When expressed by lactic acid bacteria, EPS impart

s a reaction mixture for the synthesis of a sialylated oligosaccharide is useful for synthesising sialylated oligosaccharide such as ganglioside, lysoganglioside or their mimings. Glycosyltransferases are useful for chemo-enzymatic Synthesis of oligosaccharides, including gangliosides and other oligosaccharides that have biological activity. The enzymes and nucleic acids that encode them cler useful for studies of the pathogenesis mechanisms of organisms that synthesize ganglioside mimics, such as C. jejuni and the nucleic acids are used as probes to study expression of genes involved in ganglioside mimetic synthesis. Antibodies raised against the glycosyltransferases are also useful for analyzing the expression patterns of these genes involved in pathogenesis. The oligonucleotides for inhibiting expression of the Campylobacter cards are also useful for designing antisense oligonucleotides for inhibiting expression of the Campylobacter cargmes that are involved in the biosynthesis of ganglioside mimics cargmes that are involved in the biosynthesis of ganglioside mimics of immunocers for expression are useful as diagnosing reagents or as therapeutics of an assimunocers for expendict and are involved in the biosynthesis or as therapeutics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and as immunogens for producing antibodies. Bacterial glycosyltransferase can be used to catalyse the formation of oligosaccharides that are identical to the corresponding mammalian structures and are easier and less expensive to produce in large quantity. Compared to the mammalian glycosyltransferase. The bacterial origin of the enzymes facilitates expression of large quantities of the enzymes using relatively inexpensive prokaryotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        P-PSDB; AAY97200, AAY97201, AAY97202, AAY97203, AAY97204, AAY97205

The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid letkeemia, Alzheimer's disease, Alzheitepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        16877

The invention relates to a nucleic acid (I) comprising a sequence at associated with metabolism such as DUSP2 (NM_00418), EPHXZ (NM_001979), associated with metabolism such as DUSP2 (NM_00412), EPHXZ (NM_001979), copp. (NM_000320), SGSH (NM_00199), SIHMZ (NM_001071), SIC7A2 (NM_003046), SLC7A4 (NM_00173) and TYMS (NM_001071) (all tabolism subsidiation of DNA sequences, for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNS) in a chemically created DNA of genes associated with metabolism. An array of (I) is treated DNA of genetic and/or epigenetic parameters for the application of DNA sequences, for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNS) in a chemically consistent of analysing cytosine methylations. The method involves chemically treating genetic and/or epigenetic parameters for the specific diseases by analysing cytosine methylations. The method involves chemically treating genomic DNA ample by a solution of bisulphite, chemically treating genomic DNA ample by a solution of bisulphite, which is dissimilar to cytosine in terms of hybridisation behaviour and amplifying fragments of the chemically pretrated genomic DNA. The genomic DNA is from cells or cellular components which contain DNA, cources of DNA comprising, for e.g. cell lines, biopsies, blood, sputum, created restrictions, detections, prostate, lung, breast contained or metabolism and sequences further required for their regulation. Contained to their regulation. Metabolism and sequences further required for their regulation. Contained to metabolism associated with a caretal modifications of genes associated with a caretal modifications of genes associated with a caretal parameters are in particular cytosine methylations of histones which correlated metabolism second metabolism second metabolism characterial metabolism characterial metabolism characterial metabolism second metabolism second metabolism second metabolism characterial parameters are in particular sincled metab

RESULT 1
US-09-437-277-4
; Sequence 4, Application US/09437277
; Patent No. 6444447
; GENERAL INFORMATION:
; APPLICANT: THE BOARD OF REGENTS OF THE UNIVERSITY OF OKLAHOMA
; TITLE OF INVENTION: POLYMER GRAFTING BY POLYSACCHARIDE SYNTHASES
; FILE REFERENCE: 5820.551
; CURRENT APPLICATION NUMBER: US/09/437,277
; CURRENT FILING DATE: 1999-11-10
; NUMBER OF SEQ ID NOS: 6
; SOFTWARE: WordPerfect 8.0 (saved in ASCII format)
; SEQ ID NO 4
; LENGTH: 2979
; TYPE: DNA
; ORGANISM: Pasteurella multocida

Sequence 1, Application US/09816028A

Patent No. US20020042369A1

GENERAL INFORMATION:

APPLICANT: Gilbert, Michel

APPLICANT: Makarchuk, Warren W.

APPLICANT: National Research Council of Canada

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of

TITLE OF INVENTION: Canadias and Ganglioside Mimics

FILE REFERENCE: 019633-0001110S

CURRENT APPLICATION NUMBER: US 80/9/816,028A

CURRENT PILING DATE: 2001-03-21

PRIOR APPLICATION NUMBER: US 60/118,213

PRIOR APPLICATION NUMBER: US 60/118,213

PRIOR PREDICATION NUMBER: US 09/495,406

PRIOR FILING DATE: 2000-01-31

NUMBER OF SEQ ID NOS: 49

SOSTWARER PATENTING DATE: 2000-01-31

SOSTWARER PATENTING NOS: 49

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 26, Application US/09816028A

Patent No. US20020042369A1

GENERAL INRORAMION:

APPLICANT: Gilbert, Michel

APPLICANT: Wational Research Council of Canada

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of

TITLE OF INVENTION: Ganqliosides and Ganglioside Mimics

FILE REFERENCE: 019633-0001110s

CURRENT APPLICATION NUMBER: US/09/816,028A

CURRENT APPLICATION NUMBER: US 60/118,213

PRIOR FILING DATE: 1999-02-01

Sequence 5558, Application US/09960352

Patent No. US20020137139a1

GENERAL INFORMATION:

APPLICANT: Warren, Wesley C.

APPLICANT: Tao, Nengbing

APPLICANT: Mathialagan, Nagappan

TITLE OF INVENTION: NUCLEIC ACID AND OTHER MOLECULES ASSOCIATED WITH LACTATION AND

TITLE OF INVENTION: MUSCLE AND FAT DEPOSITION

TITLE OF INVENTION: US/09/980, 352

CURRENT APPLICATION NUMBER: US/09/960, 352

CURRENT FILING DATE: 2001-09-24

NUMBER OF SEQ ID NOS: 13112

SEQ ID NO 5558

LENGTH: 431
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Sequence 2, Application PC/TUS9907289
GENERAL INFORMATION:
APPLICANT: Board of Regents of the University of Oklahoma
APPLICANT: Board of Regents of the University of Oklahoma
TITLE OF INVENTION: NUCLEIC ACID ENCODING HYALURONAN SYNTHASE AND METHODS
TITLE OF INVENTION: OF USE
FILE REFERENCE: 617022-7
CURRENT APPLICATION NUMBER: PCT/US99/07289
CURRENT FILING DATE: 1999-04-01
EARLIER APPLICATION NUMBER: 60/080,414
